Design Technique:
↳ Design a Solution before implementation.

1) Pseudocode:
↳ way to explain algorithm logic.

Take two inputs : x, y
Add them : x+y
Display on screen.

a) Top-level design:
↳ Major module.
↳ Input → Calculation → Output.
SName, Marks → Percentage, Highest Percentage → Display sName & Highest percentage
↳ Module helps us to divide a problem & Solve Efficiently
↳ Reuseability.

b) Data Flow:
↳ [Where to Start, where we end.]
IN , OUT

IN: What goes in / what we give to function.
OUT: What we get / what output function gives us.

↳ Input: IN:
OUT: sName, Marks.

↳ Calculations: IN: Marks
OUT: Percentage.

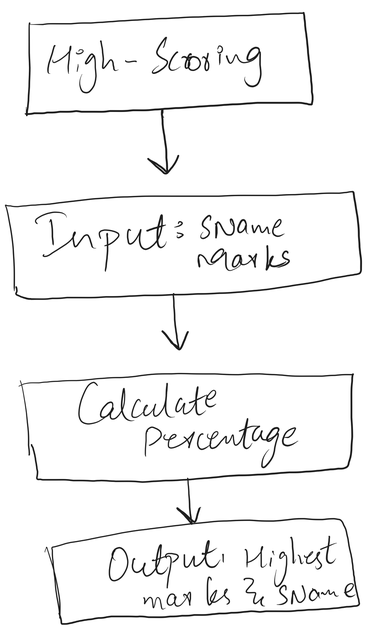
↳ Output: IN: Percentage, SName
OUT: High Percentage with SName.

INPUT —Data→ Calculate —Data→ Ouput.

↳ Follow a sequence.

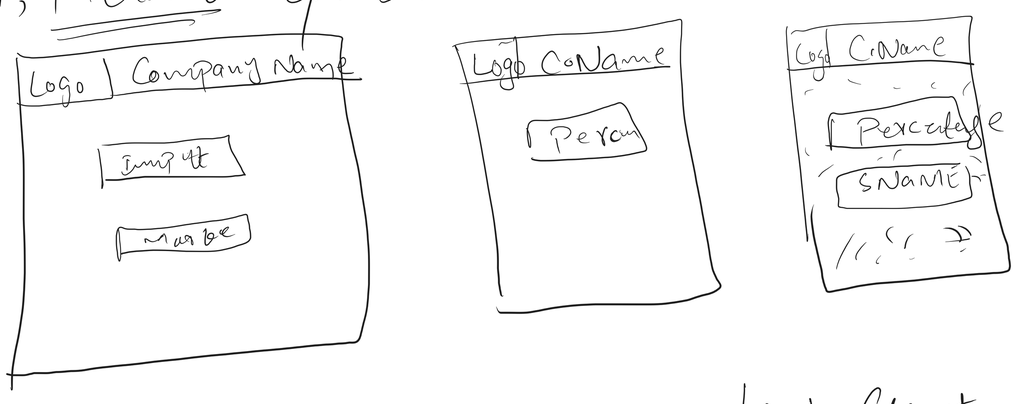
c) Refinement:
↳ Improve efficiency by modulling & data flow.
↳ Detail

2) Structure Diagram:
↳ Graphical representation of module.



↳ Modules:
↳ Complete Structure.
↳ Data Flow:
↳ Relation between modules.
(Dependent, Independant)

3) User Interface Design:
↳ To interact.
↳ Figma, Canva, Pictorial representation.



↳ Get approval of UI before Coding it / Ask Client for any design

a) Wireframe:
↳ Design a frontend.
↳ GUI

↳ Principles: Clear, Logical, Readable, Usable, Consistent.

FrontEnd	Backend
On-Screen User Interface User Experience Animations etc.	Calculations Database Storing Deletion etc

↳ Get approval
↳ Connect it with application/Backend. in implementation phase.
